

WOOLLY APHID

Symptoms - sticky white 'wool' is produced on the stems and joints of branches. Eventually galling will occur and disfigure the plant. They can be difficult to control as the fluffy wool protect the aphid from many sprays.

Control methods include using lacewing larvae, garlic barrier or spraying with an insecticide such as Bio greenfly killer plus, bug free, Bio Organic Pest control and bug clear. Also a good strong blast from a hose will dislodge most of the pests.
